- How Gadgets Changed Our Lives?

Changes in lives of people due to e-gadgets

For surviving in this world we have to continuously develop ourselves. Millions of year ago human used only stones and other naturally available equipments for hunting. But then they got civilised and developed themselves and human are at this stage where the **thinking is the only limit**. We just have to think and things will be made. That is how electronic-gadget rather technology was born.

This is 21st century and our lives are completely dependent on gadgets. Not only the common user but also developers who are working on technology and gadgets are also dependent. After the survey I have done in my locality and after listening to some podcasts and reading some blogs I have come to a conclusion we all don't miss a single minute to interact with technology. We start our day by listening to news from TV , getting news updates from the social media then switched to online portal mode for office or school by using _**internet**_ . We get assignments or projects or some other work in online apps and we also submit using the online apps. We don't need to be closer enough to talk to each other rather we use applications like whatsapp to have a interaction. Moreover people don't travel to see places rather they use facebook to see the places using feeds. Content Management System like blogging or different video platforms help us to share our thoughts and thinking to other people around the globe. We don't need posters for promoting our business rather we use websites. Internet is vast platform for creators. They can use products such as youtube for sharing their content. Even for getting information we don't need to traverse books rather we use to prefer google search engine. In practical subjects like physics and chemistry for giving demonstration teachers are using computer visualisation tools for giving explanations to the students so that the student can understand the concepts properly. It also helps farmer for doing proper farming. They use tractors , water pumps and fertilizers for cultivating their field. Programmers are using the technology and gadgets for building proper products and transferring them to the community. Earlier we have to build our setup of deployment which was cumbersome but due to rising of cloud services we can rent virtual machines for deployment. Even mobile phone which itself is a gadget is getting evolved day by day. Most of the people use online shopping portals for doing shopping which is actually a time saver.

Some old aged people told me that earlier their morning used to start with newspapers then they used to do some exercises and then went for the work to earn livelihood. But now a days the scenario is totally inverted. Today we are starting our day with mobile phones not for seeing news but for using social media to see and post not so important feeds. Many youth are devoting their life just for clicking some snapshots. Many cases happened where youth went in the front of the train to click some pictures. It is also increasing the distances of relationships. The that we should spent with the closer ones we use to spent them with the gadget. In many blogs it is written that whenever a group of people went outside like restaurant for spending a quality time instead of doing that they spend time with their phones.

Though their thought was generally giving us a picture of the negative side of today's world and was biased. There are positive sides also. Today during this pandemic that our world suffering from technology and electronic gadgets played a important role. If proper technology was not available then economy of each and every country would go down. Almost 70% of the human species would die due to lockdown. The reason for this thought is people would not be able to work and due to this they would not be able to earn money and they would not have food to eat and consequently they

would die due to hunger. But ***internet*** which is the biggest invention of technology connected all people throughout. Companies and people don't stopped their work rather they switched to work from home mode. Schools , colleges and universities taken the same policy and students did not get separated from the node of the education. Also people can learn new skills from the internet and increase the size of their skill set.

In a nutshell, e-gadgets have both positive and negative effects on our lives. Those who know to use technology in a proper way then it will be a sure advantage for them. And for others it is nothing but a **rattrap** .

In my opinion and observations, for getting a positive effect we have to use gadgets in proper way. And if I talk how I use technology then as a student I always try my best to use the technology in a properway and for learning new things.
